Amon Carter Museum of American Art

1. Introduction - José Guadelupe Posada (1852-1913)

- Mexican Artist active during the turn of the 20th century.
- Dubbed by many scholars as the "Father of Modern Mexican Printmaking".
- Posada producted thousands of illustrations (est. 2000 – 20,000).
- Posada's work extremely influential and paramount to the development of modern Mexican art, influencing many artists including Diego Riviera and Jose Clemente Orozco.
- Most iconic imagery is *Calavaras* - skeleton caricatures. They appear everywhere, particularly during Day of the Dead celebrations.

La Calavera Catrina

1. Introduction – Posada and the Amon Carter Museum

- Approximately 400 prints attributed to Posada and 25 printing blocks.
- Collection is in reasonable condition with many broadsides retaining their vivid colors.
- However, multiple items flagged as "High priority treatment" items.
  - Unstable due to the presence of oxidised pressure-sensitive tape residue.
- Prints contain highly soluble aniline dyes.

Problem common pressure-sensitive tape removal techniques involve the use of solvents.

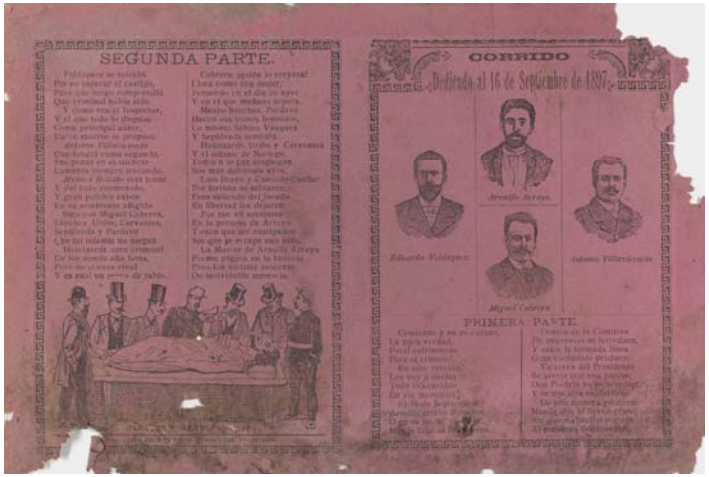
La calavera Moreliana, (n.d.)

El Mosquito Americano, ca. 1890-1913

Ya llegó calavera de la penitenciaria… (n.d.)

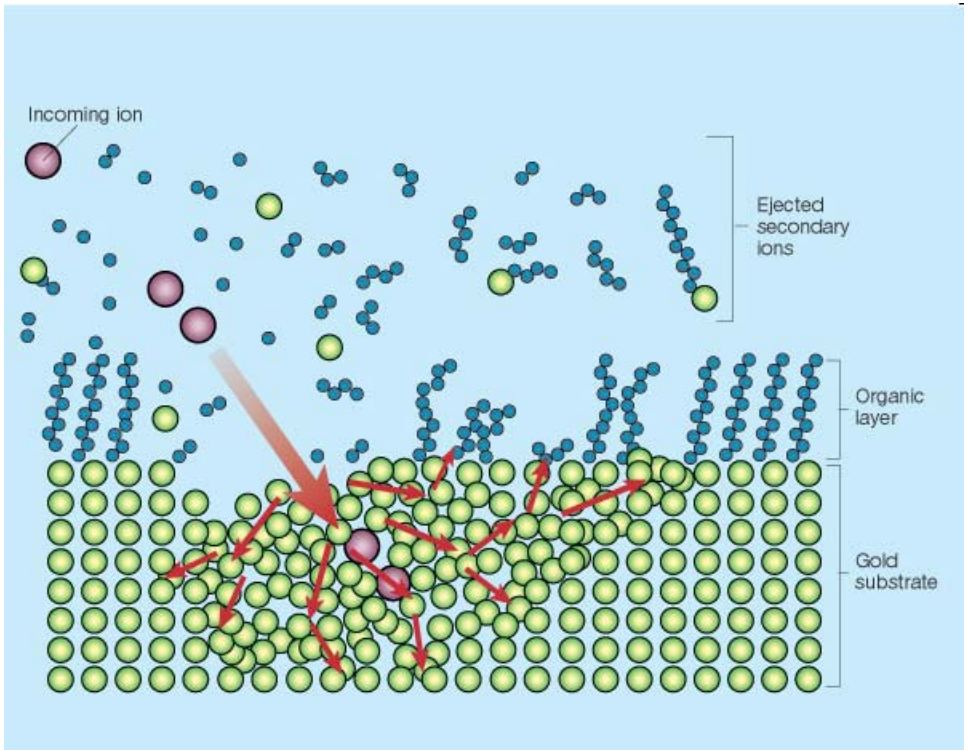
La calavera clerical, 1902

2. Samples



Yellow: 1978.119 *El Mosquito Americano*, (n.d.)
Magenta: 1978.84 *Corrido dedicado al 16 septiembre de 1897*, (n.d.)
Scarlet: 1981.47 *La continuación, señores de los pronósticos va; apréndanlos de memoria que ya se van a acabar*, 1904
Orange: 1986.20 *Guadalupe Bejarano en las bartolinas de Belen. Careo entre la mujer verdugo y su hijo,* (n.d.)
Green: 1978.182 *Ya llegó calavera de la penitenciaria, no se arruguen cueros viejos oue [sic] aquí está Rafael Buendía,* (n.d.)

3. Time-of-Flight Mass Spectrometry (TOF SIMS)



High energy beam of ions is incident upon surface. Energy is transferred to the atoms in the sample – causing a “collision cascade”
leading to the ejection of **secondary species.**
The ejected secondary ions are detected (weighed) using a mass spectrometer.

Advantages: Very sensitive ⇒ can use small sample sizes
Can detect inorganic and organic materials
Little or no sample preparation needed

D.G. Castner, Nature 422, 129-130(13 March 2003)

What’s next?

Gore-Tex with solvent

- Gore-Tex sandwich applied to recto of sample
- Adhesive was scraped/swabbed off once swelled
- Series of 12 minute applications
- Interleaving layer of Japanese paper applied to absorb adhesive
- Japanese paper and Gore-Tex were changed as needed

Purple sample undergoing Gore-Tex treatment

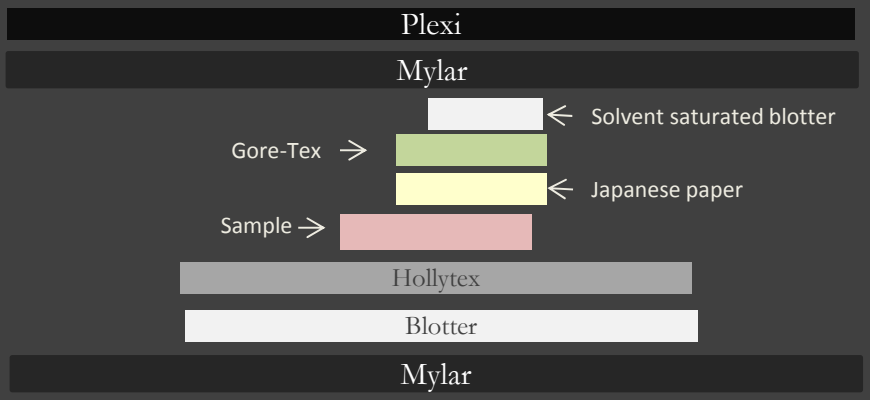

Diagram showing Gore-Tex set up

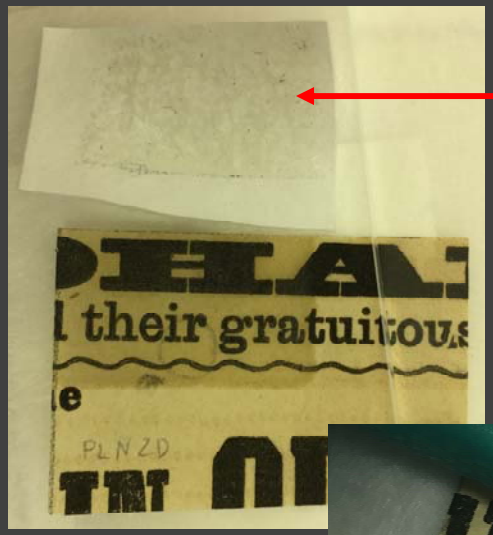
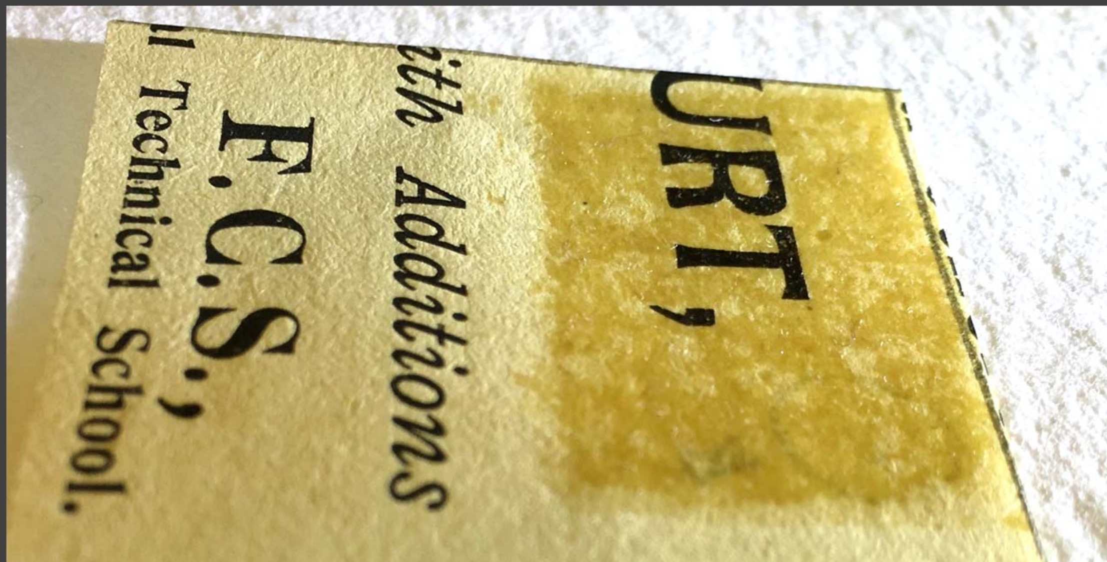
Gore-Tex with solvent results

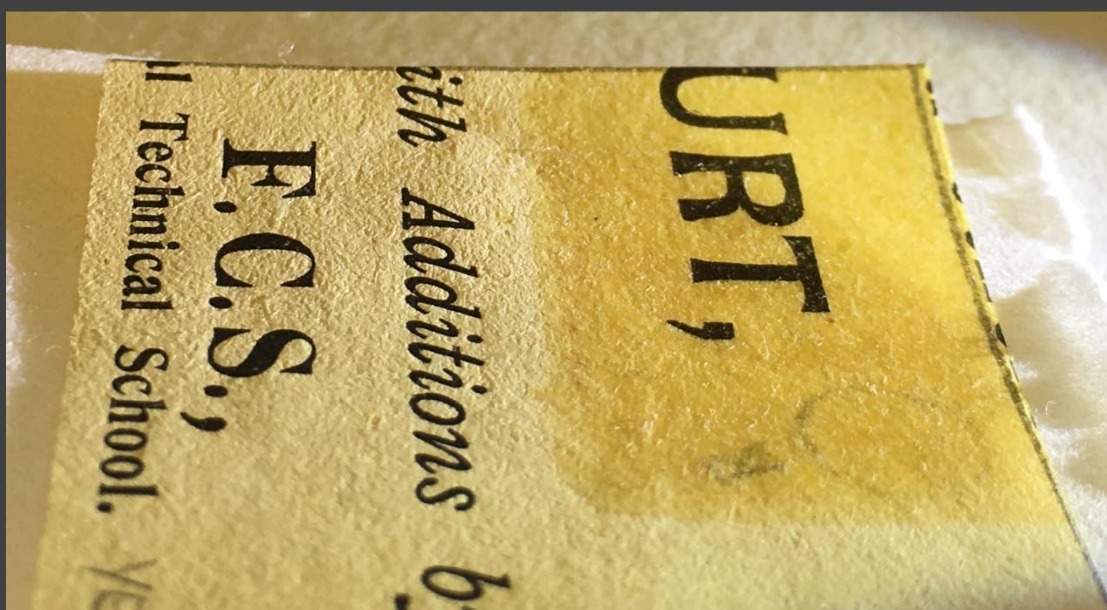
- Effective with samples with carriers
- Reduced residue but stains remained
- Minimal tidelines – controllable
- No bleeding of dye occurred
- Tacky samples picked up Gore-Tex fibers – further treatment will reduce this
- Longer treatment times ~ 10 – 15 applications (12 minute)



Adhesive deposited onto Gore-Tex

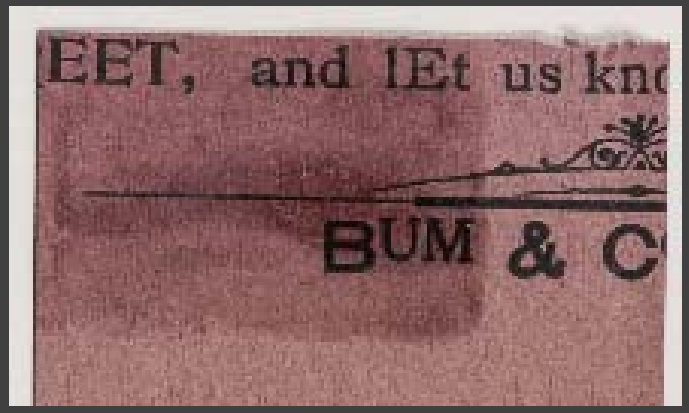
Carrier removed while keeping the Gore-Tex sandwich in place

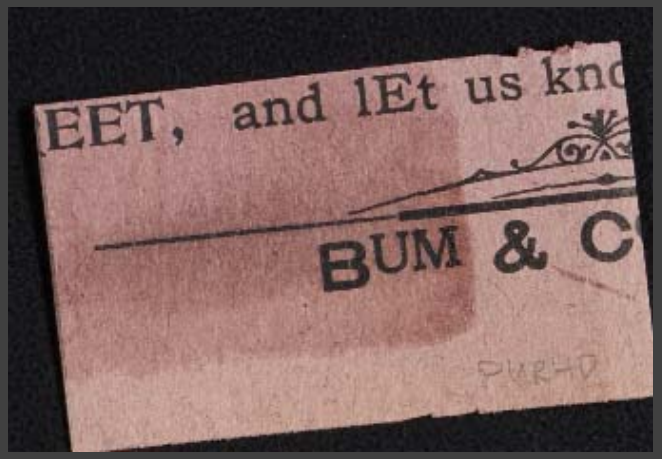




Visible reduction of surface adhesive – samples no longer tacky – yellow masking tape after 4x 12 min applications

Gore-Tex with solvent results (Rubber cement)

Purple - Rubber cement (Xylene)	
Before	After
	




5. Maximum *a posteriori* (MAP) reconstruction

The probability that sample parameters $\boldsymbol{\theta}$ are correct given data $\boldsymbol{E}$ is found from Bayes' Theorem (1763):

$$\boldsymbol{P(\theta|E)} = \frac{P(\boldsymbol{E}|\boldsymbol{\theta}) \cdot P(\boldsymbol{\theta})}{P(\boldsymbol{E})} \propto P(\boldsymbol{E}|\boldsymbol{\theta})$$

…if no prior information $P(\boldsymbol{\theta})$ is available.

$\boldsymbol{P(\theta|E)}$ = probability of true image given the data we got

Can we use MAP analysis to help us identify the dyes and ultimately obtain information about the paper used?

R. C. Puetter, T. R. Gosnell, A. Yahil, *Ann. Rev. Astron. Astr.* **43** 2005, 139
Lee, D. D., Seung, H. S., *Advances in neural information processing systems 13,* **2001**, 556-562.

7. Discussion and Conclusions

1. Working together is very rewarding!
2. Communication is key.
3. We have identified the dyes used in Posada's broadsides using SIMS. Raman spectroscopy, which is commonly employed, has had limited success especially in identifying blue and yellow pigments.
4. Stacy Kelly and Jodie Utter were able to develop new methods to remove pressure sensitive tape from the broadsides.
5. Using MAP analysis we are able to obtain both the mass spectra of the acidic and basic aniline dyes, and also the paper stock.
